EDR

Endpoint Detection and
Response

The Chaos

TryHackBox

E

Endpoint

endpoint refers to any device that connects to a network and serves as an entry or exit point for data like laptops, smartphones, servers, tablets, or even IoT gadgets such as smart cameras. These are prime targets for attackers.

The Chaos

TryHackBox

Detection

detection is the core process of identifying potential threats, malicious activities, or anomalies in your network, systems, endpoints, or user behavior; like spotting malware, unauthorized access, or unusual data flows before they cause real damage.

The Chaos

TryHackBox

Response

response (often called incident response) is eradicating the root cause (like removing malware or patching vulnerabilities), recover affected systems, and restore normal operations while minimizing downtime and data loss.

The Chaos

TryHackBox

(EDR) is a cybersecurity solution that **continuously monitors** and analyzes endpoint activities to **detect, investigate, and respond** to cyber threats such as malware and ransomware. It records system-level behaviors, uses data analytics to **identify suspicious activity**, and **provides automated threat response** and remediation. EDR integrates real-time monitoring, threat intelligence, and automated response to protect network-connected devices, including desktops, laptops, mobile phones, servers, and cloud workloads.

The Chaos

TryHackBox

Functions

- Monitor endpoint behavior
- Investigate incidents

- Detect suspicious activity

- Response to threats
